# Biological Risk Management

## TOOLBOX FOR MOBILE CLINICS

To address the concerns regarding an infectious disease entering or spreading within a mobile veterinarian's work environment or within a mobile veterinary clinic, the CFSPH has designed a biological risk management toolbox. It consists of educational materials, an online database containing assessment questions, management recommendations, and resources that enable veterinarians to objectively evaluate their facilities and to identify opportunities for improvement. The database and all other BRM Toolbox materials can be accessed at: [www.cfsph.iastate.edu/BRM](http://www.cfsph.iastate.edu/BRM). Registration is required to utilize the online database.

Our vision for the use of these resources is as follows:

- A veterinarian begins by reading the Overview of BRM document.
- Next, the BRM for mobile veterinarians document should be read. It is designed to refresh knowledge regarding management practices and routes of transmission that influence disease transmission.
- After reviewing the document, the veterinarian is ready to evaluate his/her facility or work environment using a question set created in the online database. The questions are based on routes of disease transmission and designed to be answered yes/no/maybe, with yes being the ideal response.
- By entering the responses to the questions into the online database, several different reports can be generated.
  - Management recommendations will be provided for all questions answered no/maybe. These provide guidance to the veterinarian for implementing improvements.
  - Current prevention practices will highlight the areas of strength in a facility or work environment for all the questions answered yes.
  - Routes of transmission charts are generated based on all responses (yes, no, maybe) to identify which routes are most neglected by the operation and identify opportunities for improvement.
- The final step is to communicate this information to clients and employees. Together, a management plan can be designed based on the information provided in the BRM Toolbox to minimize disease risk.
- Goals can be set based on current needs and short- and long-term objectives. Continued assessments should be conducted to chart progress. Resources, human labor, economics, and animal/human health risks need to be considered in the design and implementation of any management plan.
