In a foreign animal disease (FAD) incident, control and containment of the disease agent is essential to eradication and recovery. Quarantine and movement control (QMC) are critical activities to protect animal health, by helping to prevent the disease agent from being transmitted to non-infected livestock and poultry populations. QMC stops and controls movements in a regulatory Control Area. This presentation focuses on diseases spread by direct and indirect contact rather than vector-borne diseases, as QMC is not particularly effective at preventing the movement of mobile insect vectors. However, QMC activities can still prevent the movement of infected hosts, which may be important in vector-borne FAD incidents. In an incident, quarantines and movement controls are handled through Unified Incident Command, following local, State, and Federal laws/regulations. [This information was derived from the Foreign Animal Disease Preparedness and Response (FAD PRoP)/National Animal Health Emergency Management System (NAHEMS) Guidelines: Quarantine and Movement Control (2016)].

This presentation will present some definitions of terms that may be used when referring to quarantine and movement control (QMC) in an emergency situation regarding an FAD outbreak. It will also discuss the goals of an FAD response and of quarantine and movement control, explain the authority of agencies responsible for dealing with animal and product movement during an FAD outbreak, and briefly present general information applicable to an FAD response, including an introduction to a regulatory Control Area.

S
I
D
E
3

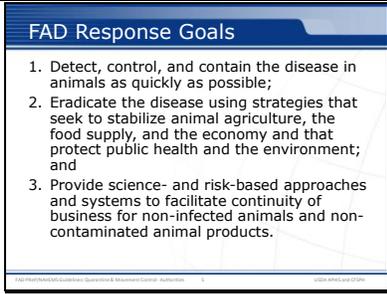

For the purpose of this document, the following terms and definitions will be used: **Quarantine** refers to imposing stringent restrictions on entering or leaving a premises, area, or region where disease is known to exist or is suspected. During an FAD outbreak, a quarantine broadly prohibits the movement of animals, animal products, and fomites (e.g. equipment, vehicles, clothing, footwear) from a specified premises, area, or region. Consideration is given to critical movements like feed trucks. **Hold order** is a temporary order, similar in effect to a quarantine, typically implemented while additional diagnostics or investigation is conducted. Hold orders are usually, but not always, under State authority: definition, scope, and terminology may vary by State. **Standstill notice** is the temporary prohibition of the initiation of any new movement of the susceptible species in a defined area. A standstill notice is typically implemented at a Federal level, put into effect through an official notice and subsequent publication in the Federal Register.

S
I
D
E
4

A continuation of these definitions include: **Movement control** refers to controlling the movement of animals, animal products, and fomites in a regulatory Control Area. These movements are from non-infected premises, require permits, and are based on meeting specific criteria to ensure that such movement poses a negligible risk of pathogen transmission. **Continuity of business (COB)** is a specific type of movement control known as managed movement. COB typically focuses on a specific commodity and is intended to mitigate the economic effects of a regulatory Control Area.

QMC activities are a critical component of a response effort. Three response goals for an FAD outbreak in the United States as outlined in the *APHIS Foreign Animal Disease Framework: Response Strategies (FAD PReP Manual 2-0)* are:

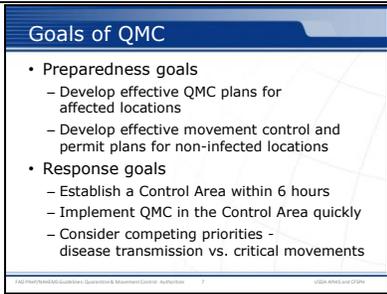

- Detect, control, and contain the disease in animals as quickly as possible;
- Eradicate the disease using strategies that seek to stabilize animal agriculture, the food supply, and the economy and that protect public health and the environment; and
- Provide science- and risk-based approaches and systems to facilitate continuity of business for non-infected animals and non-contaminated animal products.

S
I
D
E
6

Achieving these three goals will allow individual livestock facilities, States, Tribes, regions, and industries to resume normal production as quickly as possible. The objective is to allow the United States to regain disease-free status without the response effort causing more disruption and damage than the disease outbreak itself. Biosecurity plays a vital role in each of these goals.

S
I
D
E
7

The QMC-specific goals support overall FAD response goals.

The preparedness goals are as follows:

- To work with stakeholders to develop effective plans and processes for affected premises, areas, and regions.
- To work with stakeholders to develop effective managed movement plans for non-infected premises, areas, and regions.

The response goals are as follows:

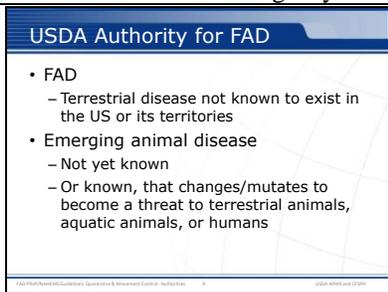

- Through a Unified Incident Command, coordinate the establishment of an Infected Zone and a Buffer Zone (a Control Area) within 6 hours of identifying the index case.
- Once a Control Area has been established, implement QMC in the Control Area as rapidly as possible.
- Ensure QMC considers competing priorities, weighing the risk of disease transmission against the need for critical movements (e.g., feed trucks) and business continuity.

Both Federal and State agencies have authority to protect against and respond to animal disease. The Code of Laws of the United States of America (U.S.C.) and the Code of Federal Regulations (CFR) are codified authorities representing different stages of the legislative process. The U.S.C. provides the general and permanent statutes of the United States, which are passed by Congress and signed by the President. Executive branch agencies then interpret the U.S.C., developing detailed regulations in the CFR. The CFR is developed through a public rulemaking process, where the public is allowed to comment. In an FAD incident response, the U.S.C. and CFR provide policy, via statutes and regulations, for USDA; interim regulations can be implemented—in the event of an outbreak—to prevent the spread of disease.

An FAD is a terrestrial animal disease or pest, or an aquatic animal disease or pest, not known to exist in the United States or its territories. An emerging animal disease may be any terrestrial animal, aquatic animal, or zoonotic disease not yet known or characterized, or any known or characterized terrestrial animal or aquatic animal disease in the United States or its territories that changes or mutates in pathogenicity, communicability, or zoonotic potential to become a threat to terrestrial animals, aquatic animals, or humans.

0

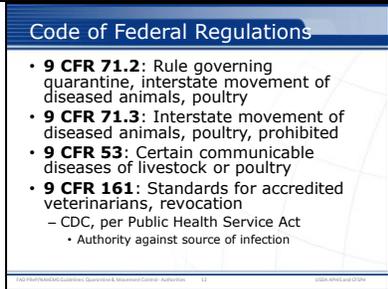

An FAD or emerging animal disease may involve livestock, poultry, other animals, and/or wildlife. In the event of an FAD or emerging animal disease outbreak in domestic livestock that involves wildlife, USDA APHIS will work in close collaboration, communication, and coordination with State, Tribal and Federal wildlife agencies that have primary jurisdictional authority and subject matter expertise for wildlife. For more information, consult *APHIS VS Proposed Framework for Response to Emerging Animal Diseases in the United States* for responding to such incidents.

APHIS receives its permanent and general regulatory authority from the Animal Health Protection Act (AHPA), 7 U.S.C. 8301 *et seq.* The AHPA enables the Secretary of Agriculture to prevent, detect, control, and eradicate diseases and pests of animals, including foreign animal and emerging diseases, in order to protect animal health, the health and welfare of people, economic interests of livestock and related industries, the environment, and interstate and foreign commerce in animals and other articles. The Secretary is specifically authorized to carry out operations and measures to detect, control, or eradicate any pest or disease of livestock, which includes poultry, 7 U.S.C. 8308, and to promulgate regulations and issue orders to carry out the AHPA (7 U.S.C. 8315). The Secretary may also prohibit or restrict the importation, entry, or interstate movement of any animal, article, or means of conveyance to prevent the introduction into or dissemination within the United States of any pest or disease of livestock (7 U.S.C. 8303-8305).

Title 9 of the CFR provides detailed USDA APHIS regulations for the control and eradication of animal diseases, including FADs and emerging animal diseases. Following are several key sections of the CFR to safeguard public health, animal health, animal products, interstate commerce, and international trade:

- 9 CFR 71.2**
Secretary (of Agriculture) to Issue Rule Governing Quarantine and Interstate Movement of Diseased Animals, Including Poultry
- 9 CFR 71.3**
Interstate Movement of Diseased Animals and Poultry Generally Prohibited
- 9 CFR 53**
Foot-and-Mouth Disease, Pleuropneumonia, Rinderpest, and Certain Other Communicable Diseases of Livestock or Poultry
- 9 CFR 161**
Requirements and Standards for Accredited Veterinarians and Suspension or Revocation of Such Accreditation.

Interstate is defined in 9 CFR 71.1 as follows: From one State into or through any other State. In addition, the Centers for Disease Control and Prevention (CDC) has the authority, per the Public Health Service Act, and 42 CFR 70.2 to “take such measures to prevent such spread of diseases as he/she deems reasonably necessary, including inspection, fumigation, disinfection, pest extermination, and destruction of animals or articles believed to be sources of infection.”

State Authority for FAD

- Initially, State, Tribal, local authorities and resources
- Authority granted to SAHO varies
- Quarantine
 - May be issued based on FAD detection or suspicion
 - Scope based on specific authority
 - Intended to control disease intrastate
 - Become familiar with your State's laws

Initial FAD response and enforcement of QMC will involve State, Tribal, and local authorities and resources. Authority granted to the State Animal Health Official (SAHO) varies from State to State. Legal authority is granted via statute by a legislating body, and regulations are promulgated by an executive agency under this statutory authority. Quarantine on a premises—or movement restrictions—within a Control Area may be issued, based on an FAD detection or a suspected FAD. These may include quarantines of an individual pen, herd, flock, premises, county, section, or area, depending on the specific State authority. State quarantines are used to stop and control the spread of an infectious or contagious disease within a State. Since statutes and regulations vary by State, it is important to become familiar with and follow the laws, regulations, and terminology of your State, Tribal Nation, and/or locality.

Extraordinary Emergency

- Declared by US Secretary of Agriculture
- Federal government authorized to control intrastate movement
 - In addition to interstate and international movement
- No Extraordinary Emergency declared during HPAI outbreak in US (2014-2015)
- Regulatory intervention
 - By Unified Incident Command

While typically States control intrastate movements, it is important to recognize that if the United States Secretary of Agriculture declares an Extraordinary Emergency, the Federal government is then authorized to control *intrastate* movement, in addition to interstate movement and international movement. Please note in the highly pathogenic avian influenza (HPAI) outbreak in 2014–2015, the largest animal health incident ever in the United States, there was no Extraordinary Emergency declaration. Additionally, an FAD outbreak in the United States may result in emergency regulatory intervention by State, Tribal Nations, and Federal authorities via a Unified Incident Command.

*Responding to an FAD:
General Information*

General information that applies to an FAD emergency response includes epidemiological principles, simultaneous activities, and the establishment of regulatory Control Areas.

S
I
d
e
1
6

Epidemiological Principles

- Prevent contact
 - Quarantine, movement controls, biosecurity, depopulation
 - Avoid risk of mechanical vectors
- Stop production of disease agent
 - Depopulation (and disposal) of infected and potentially infected animals
- Increase disease resistance or reduce shedding
 - Emergency vaccination, if suitable vaccine, administered in timely manner

The need for QMC activities is based on the three basic epidemiological principles of response. These three principles form the foundation of any FAD response strategy to contain, control, and ultimately eradicate the disease in the U.S. domestic livestock or poultry population.

- Prevent contact between the disease and susceptible animals.*
 - This is accomplished through quarantine of infected animals, movement controls in the Infected Zone(s) and Buffer Zone(s) (Control Areas), and biosecurity procedures to protect non-infected animals.
 - Certain circumstances may warrant accelerating the depopulation of animals at risk for exposure to the disease to decrease the population density of susceptible animals.
 - There is a serious but lesser transmission risk posed by people, material, conveyances, and non-susceptible animals that may have been in contact with the disease and serve as mechanical vectors. Contact with susceptible animals should be prevented and transmission risk mitigated through biosecurity and cleaning and disinfection measures.
- Stop the production of the disease agent.* This is accomplished by the slaughter or mass depopulation (and disposal) of infected and potentially infected animals.
- Increase the disease resistance of susceptible animals or reduce the shedding of the disease agent in infected or exposed animals.* This can be accomplished by emergency vaccination if a suitable vaccine is available and can be administered in a timely manner.

Critical Activities

Critical Activities and Tools for Containment, Control, and Eradication

- Public awareness campaign
- Swift imposition of effective QMC
- Rapid diagnosis and reporting
- Epidemiological investigation and tracing
- Increased surveillance
- COB measures for non-infected animals and non-contaminated animal products
- Biosecurity measures
- Cleaning and disinfection measures
- Effective and appropriate disposal procedures
- Mass depopulation and euthanasia (as response strategy indicates)
- Emergency vaccination (as the response strategy indicates)

During an FAD response, many activities must be conducted simultaneously to achieve the goals of an FAD response. This chart lists some of the critical activities which occur in an FAD outbreak, including QMC. Other activities, such as surveillance, diagnostic testing, COB, disposal, and vaccination will also help to rapidly and effectively control, contain, and eradicate the disease. [Critical Activities and Tools for Containment, Control, and Eradication. Content provided by: USDA]

Activities in First 72 Hours

A vertical timeline diagram showing various activities occurring from the moment of detection through the first 72 hours of an outbreak. Activities include: Detection, Confirmation, Initial Assessment, Control Area Designation, Quarantine Implementation, Surveillance, and Vaccination. A large blue arrow points downwards, indicating the progression of time.

This figure shows the critical activities that will take place within the first 72 hours of an outbreak, beginning with the detection of an FAD in domestic livestock. Many of these activities that are initiated in the first 72 hours continue throughout the response, such as quarantine and movement controls, biosecurity, surveillance, and tracing. These critical tasks are fundamental to the rapid control and containment of the disease. [Critical Activities in the First 72 Hours of an FAD Outbreak. Content provided by: USDA]

Zone, Area, Premises Designations

- Control Area =
 Infected Zone + Buffer Zone
- Quarantines in Control Area
 - Infected Premises
 - Contact Premises
 - Suspect Premises
- Response zones/areas likely to change over the course of the incident

Immediately after an FAD detection, a regulatory Control Area, comprised of an Infected Zone and Buffer Zone, will be designated. Quarantines will be implemented for Infected, Contact, and Suspect Premises in this regulatory Control Area. As the epidemiological investigation continues, the incident may become more complex, demanding additional resources. Response zones and areas are likely to change and be redefined over the course of an incident.

Zones, Areas, Premises

Two maps illustrating FAD response zones and premises. The left map, 'Zones and Areas', shows a central 'Infected Zone' (dark pink) surrounded by a 'Buffer Zone' (blue), with an outer 'Vaccination Zone' (yellow) and 'Surveillance Zone' (light blue). The right map, 'Premises', shows 'Infected Premises' (dark pink), 'Contact Premises' (blue), and 'Suspect Premises' (yellow) within the Control Area, and 'At Risk Premises' (light blue) in the Buffer Zone. A legend at the bottom identifies the colors for each zone and area.

During an FAD outbreak, geographic locations are classified or designated according to specific criteria related to disease or disease-free status. These designations help to associate specific response activities with specific locations. These figures show examples of zones and areas on the left, and examples of the locations of premises that have been designated with specific classifications on the right. QMC activities focus on the Control Area - comprised of the (dark pink) Infected Zone depicted in the center of the map, which surrounds all known Infected Premises, plus the (blue) encircling Buffer Zone. As mentioned in the last slide, quarantines are implemented for Infected, Contact, and Suspect Premises in the Control Area. It is important to note that these figures are examples, and are not to scale. More detail on designations of zones, areas, and premises, and the factors considered in determining their size is explained in the FAD PRoP/NAHEMS Guidelines; Quarantine and Movement Control document, and in the Zones, Areas and Premises PowerPoint presentation associated with this series. Authority Coordination

- Quarantine and movement control
 - Federal – interstate and international
 - State – intrastate
- Continuity of Business (COB)
 - Management movement
 - Negligible risk of pathogen transmission
 - Minimize significant disruptions
- Coordination authority, resources, and expertise

Quarantine and movement control activities are important interventions to control and contain an FAD. Usually Federal quarantines and movement restrictions are instituted to control interstate and international movement of infected animals and contaminated animal products; States may restrict the intrastate movement of animals, animal products, equipment, and other items. Under certain circumstances, Federal authorities may be able to also limit intrastate movement. Continuity of business (COB), also referred to as management movement, helps to ensure that such movement poses negligible risk of pathogen transmission, yet is intended to minimize significant disruptions in business operations and avoid severe economic consequences that may result. A highly contagious FAD will involve Federal authority, resources, and expertise closely coordinated with State, local, and Tribal government authority and resources.
